

Put your work in your pocket and go

Today's workforce is mobile, and if you want to get the best work out of your people, you need to give them every tool it takes to be productive on the go.

Nintex Mobile extends digital workflows, enabling employees to keep critical processes moving, no matter where they are. Built for smartphones and tablets, Nintex Mobile is optimized for people on the go, wherever they are.

With Nintex Mobile, you can check your tasks as easily as checking your texts. The mobile apps allow you to capture data, submit requests, start processes, complete tasks, approve documents and more.

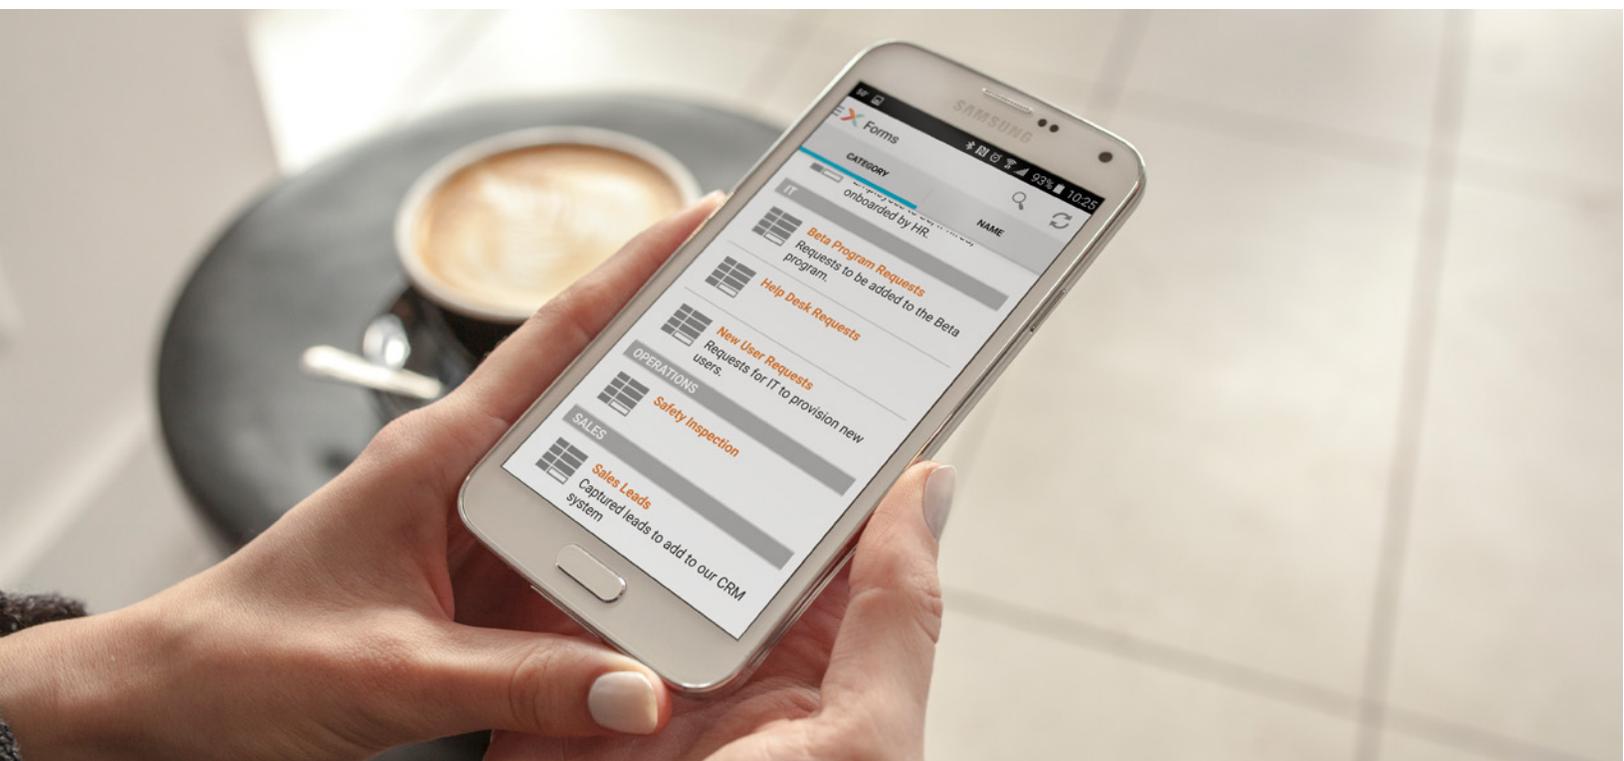

Submit requests, start processes, complete tasks and more

Mobile data collection

Mobile forms allow mobile workers to gather data like marketing and field surveys, safety and quality checks, food and hygiene checks, geological and property inspections, maintenance reports, hospital admittance forms and many more.

Everyday mobile device features like image and video attachments, barcode and QR code scanning, geolocation tagging, signature capture and more can be used within Nintex Mobile for a rich mobile experience.

Nintex Mobile lets the mobile worker do their job wherever work takes them - around the corner, in the field, or even underground. The offline capabilities of Nintex Mobile allow all forms to be stored on devices, safely holding them until the user is back online.

Build native mobile process apps

With Nintex App Studio, formerly referred to as Nintex Mobile Enterprise, you can put powerful, purposeful workflow apps in the hands of your workforce without a single line of code. Design and deliver specific workflow apps for iOS, Android and Windows devices using Nintex workflows and forms that can be tailored to each department or process, including the look and feel of each application.

U.K.'s largest pub and restaurant operator raises the bar with Nintex

Mitchells & Butlers is the UK's largest operator of managed restaurants and pubs, with more than 1,700 businesses within the UK. The retail business managers at Mitchells & Butlers regularly examine a big stack of forms: forms for pre-opening checks and closing checks; health and safety checks; cleaning schedules for storerooms and kitchens; general manager's checklists; corrective action lists; and many more. When managers complete the review at one facility, they'd go to the next and start the process all over again. In all, they inspected 3 million pieces of paper per year. According to the Safety Assurance Department, the manual completion and inspection of forms was a completely and utterly counterproductive process. It added nothing to the safety management system and kept the managers from adding real value to the company.

To address all of the deficiencies it had with its paper-based system, Mitchells & Butlers developed a solution using Nintex Mobile and Nintex Forms for Office 365. Putting the solution in the cloud enabled the company to avoid the need to build and maintain on-premises infrastructure. It gave them the agility to bring the solution up quickly and adapt forms to meet changing business needs. And it became part of a much larger effort that eventually centralized reporting and enhanced communications throughout the company.

Instead of having to complete and store paper forms, managers now complete forms on Samsung Galaxy Tab 3 tablets using the Nintex Mobile app. Beyond merely automating or digitizing its paper forms, Mitchells & Butlers took advantage of Nintex Forms' functionality to create forms that are more visual, more intuitive, and faster and easier to use. The company also uses Nintex Forms to integrate due diligence and training in ways never before possible.

As a result of this Nintex Mobile solution, they're no longer buried beneath mounds of paperwork—saving approximately 23,400 hours a year. They no longer need to audit the forms; Nintex Forms flags incorrect or incomplete entries. And they can easily view the forms or aggregated reports from wherever they are so they take quick action to resolve problems, instead of discovering three-month-old problems during quarterly reviews.
